

Printing

Printing Nitoku pages is no different from printing any other web page, you can print them using the printing functionality of your browser. Nevertheless, we have made a couple of printing design decisions that we believe will provide our users with a better printing experience.

First; when you print a page, the sidebar will not be printed as part of the page, therefore if you close any dialog that may be open, the page that you print will be a clean page. "clean" in the sense that it will not include any interface buttons. You could see an example of how this page is printed here : [printing.pdf](#)

i Note that to avoid printing the frame of the window you should display the page as a web page. If the page that you want to print has a page frame, click on the "Open as web page" icon. The web page will not have a frame and you should be able to print it without any user interface details included on the printed page.

Second; Adding a header with one hashtag will add a page-break to the printed document, e.g.:

Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor in dolore magna aliqua.

Header

Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor in dolore magna aliqua. Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed incididunt ut labore et dolore magna aliqua.

Please note that the first hashtag is assumed that is the page title of the first page, therefore the first hashtag on the document will not add a page break.

Questions?

We're always happy to help with examples, code or other questions you might have. Contact [support](#) or join with other users our [chat live](#).
